

SEEK WANDER

Launch Protocol

Curated Luxury Journeys · Executive Launch Checklist
Prepared: March 21, 2026 · Classification: Confidential

PRE-LAUNCH BLOCKERS	SHOULD-DO BEFORE LIVE	POST-LAUNCH DAILY	POST-LAUNCH WEEKLY	POST-LAUNCH MONTHLY
6 items	7 items	6 checks	7 checks	6 checks

This document serves as the definitive operational checklist for the Seek Wander launch. Complete all red-flagged items before accepting payment. Retain this document for internal records.

SECTION 01 · CRITICAL — MUST COMPLETE BEFORE GO-LIVE

Pre-Launch Blockers

The following items are non-negotiable gatekeepers. The product must not accept payment or be publicly promoted until every item below is ticked.

- Stripe Paywall — implement Phase 13

Free tier: 1 generation. Paid: unlimited. Without this, the product is free with no revenue path.
- Custom domain — point seekwander.com to Vercel

Legal pages reference seekwander.com. Mismatched domain destroys trust at checkout.
- Email infrastructure — configure hello@ and privacy@ addresses

Both addresses appear in Terms, Privacy, and Refund Policy. Bounced emails = legal exposure. Use Resend, Postmark, or Google Workspace.
- Stripe webhook secret — add to Vercel env vars

STRIPE_WEBHOOK_SECRET must be set before the webhook endpoint goes live. Test with Stripe CLI: stripe listen --forward-to localhost:3000/api/webhooks/stripe

■ End-to-end user flow test

Sign up -> generate -> save -> share -> PDF export -> delete trip. Run on mobile (iOS Safari + Android Chrome) and desktop. Verify Clerk auth, Prisma writes, Supabase persistence, and offline cache all function correctly.

■ Rate limit verification

Hit POST /api/itinerary 11 times with the same userId. Confirm 429 with X-RateLimit- headers on the 11th request. Confirm the Upstash Redis dashboard shows the sliding window.*

SECTION 02 · HIGH PRIORITY — COMPLETE BEFORE PUBLIC PROMOTION

Pre-Launch Polish

These items are not hard blockers but will cause pain, cost overruns, or trust damage if left unchecked at launch.

■ Set Anthropic hard spend limit

dashboard.anthropic.com -> Settings -> Billing -> Set monthly budget cap. A traffic spike without a cap can produce a four-figure API bill overnight.

■ Set Google Maps billing alert

GCP Console -> Billing -> Budgets & Alerts -> Create alert at \$50 and \$200. Places API calls are \$0.032/call — 1,500 cache misses = \$48.

■ Audit Supabase plan limits

Free tier: 500MB storage, 2GB bandwidth, 60 concurrent connections. Know your upgrade threshold before you hit it under load.

■ Upstash Redis usage check

Free tier: 10,000 commands/day. Each generation uses ~2 commands. 5,000 generations/day = upgrade required. Check the Upstash dashboard.

■ OG / social card audit

Paste your Vercel URL into <https://opengraph.xyz> and <https://cards-dev.twitter.com/validator>. Verify the image, title, and description render correctly for link previews.

■ Favicon and PWA icon audit

Install the PWA to an iPhone home screen and an Android home screen. Verify /icon-192x192.png and /icon-512x512.png look sharp on Retina displays.

■ Mobile end-to-end test

Walk the full flow on a real phone (not DevTools). Check CurationForm field tap targets, keyboard behaviour on date pickers, and the GenerationLoader animation on mobile Safari.

SECTION 03 · ONGOING OPERATIONS — POST-LAUNCH MONITORING

Monitoring Protocol

Once live, the following cadence keeps costs controlled, quality high, and revenue growing. The three numbers that matter most are cost per generation, cache hit rate, and visitor-to-generation conversion rate.

The Three Numbers

Cost / Generation	~\$0.08 - \$0.12	CostLog table, /admin/metrics
Cache Hit Rate	>60% after week 1	/admin/metrics KPI card
Visitor -> Generation	>15% of visitors	Vercel Analytics funnel

Daily Checks (first 2 weeks)

■ Vercel Analytics — page views and top pages

Are users landing? Where are they dropping off? Check /itinerary completion rate.

■ Admin dashboard (/admin/metrics) — cost and errors

Total cost, cache hit rate, any generation 500 errors visible in the log table.

■ Supabase table growth — Trip, PlaceCache, CostLog

Healthy growth = product is being used. Spikes = investigate.

■ Anthropic usage dashboard — daily cost vs mental budget

dashboard.anthropic.com -> Usage. Compare against your monthly cap.

■ Stripe dashboard — new subscriptions, failed payments

Stripe -> Payments -> Failed. A failed payment on day 1 needs immediate investigation.

■ Vercel deployment logs — any build or runtime errors

Vercel -> Project -> Deployments -> Click latest -> View function logs.

Weekly Checks

■ Cost per generation trend

CostLog average. If creeping above \$0.15, investigate PlaceCache cold spots.

■ Cache hit rate

Should be 60%+ by end of week 1 as PlaceCache warms. Low rate = high Google API spend.

■ Conversion funnel

Visitors -> Generations -> Sign-ups -> Paid. Identify the biggest drop-off step.

■ Rate limit 429 frequency

Are legitimate users hitting the 10/hr cap? Consider adjusting slidingWindow() if so.

■ Refund requests — pattern analysis

Which destinations? Which budget tiers? Patterns reveal product quality gaps.

■ Stripe MRR movement

New subscribers minus churned. Week-over-week delta is your growth signal.

■ Booking.com affiliate click-through rate

Check Booking.com partner dashboard. Low CTR = hotel cards need copy/UX improvement.

Monthly Checks

■ Stripe MRR and churn rate

MRR growth rate and % of paid users cancelling in month 1 are your north-star metrics.

■ Vercel Cron — nightly PlaceCache cleanup

Vercel -> Project -> Cron Jobs -> Verify /api/cron/cleanup ran successfully every night.

■ API key rotation

Rotate MAPS_SERVER_KEY and CRON_SECRET. Update Vercel env vars. Verify photoReference architecture means key rotation doesn't break cached images.

■ CostLog destination analysis

Which destinations have the most cache misses (highest Google API cost)? Consider pre-warming PlaceCache for top destinations.

■ Supabase storage vs plan limits

Check DB size and bandwidth. Upgrade Supabase plan before hitting limits.

■ Review Anthropic model updates

Check if claude-sonnet-4-6 has been superseded. Evaluate cost/quality tradeoffs.

SECTION 04 · REFERENCE

Diagnostic Guide

When a metric falls outside target, use this table to identify the root cause and the correct remediation path.

SYMPTOM	LIKELY CAUSE	ACTION
Cost/gen > \$0.15	PlaceCache cold — high cache misses	Check cacheMisses in CostLog. Pre-warm top destinations.
Cache hit rate < 40%	Cron cleanup too aggressive, or new destinations	Check cron logs. Consider extending TTL from 14 to 30 days.
High visitor -> low generation	Landing page friction or form confusion	Review CurationForm UX. A/B test hero copy. Check mobile form on real device.
High 429 errors	Rate limit too tight for real users	Raise slidingWindow to 20/hr in ratelimit.ts. Monitor Anthropic cost.
Generation 500 errors	AI JSON malformed or Places API timeout	Check Vercel function logs. sanitizeJson + repair prompt should self-heal.
High refund rate	Itinerary quality mismatch or wrong destination type	Analyse refund emails by destination. Tune SYSTEM_PROMPT for problem cities.
Stripe failed payments	Card decline or webhook not processing	Check Stripe Dashboard -> Developers -> Webhooks -> verify endpoint health.

Launch Authorisation

All Section 01 blockers must be checked before this form is signed. Retain this completed document.
